Help to guarantee that your customers receive what they want, when they want it and maximize return on your inventory investment. PlanetOne ERP Inventory Control System provides full functionality coverage on inventory issues such as outgoing orders, receiving stock, returns, backorders, surplus inventory, and dead stock.

CONTROL INVENTORY WITH FLEXIBILITY

From the startup with inventory items initial setup to the various methods of valuation supported by PlanetOne ERP, our system can accommodate the wide range of daily requirements of various types of industries.

INVENTORY CONTROL

FAST AND EASY DATA ENTRY AND INQUIRY

Entering Transaction

The Inventory Control module provides features for fast data entry and inquiry. Default settings based on vendor class mean fewer fields to fill in. Data entry can be in either a batch-oriented mode, providing greater flexibility in reviewing the data entry accuracy before posting, or in a real time mode. The Inventory Control module also enables you to generate continual incoming stock.

RELIABLE CONTROLS, AUDIT TRAILS, AND DATA INTEGRITY

Inventory Status Control

To better control inventory functions, PlanetOne ERP Inventory Control allows you to designate product items as active, inactive, or one time. If a product or an item is on active status, then the item is subject to all normal inventory control processes. To ensure proper inventory processing, PlanetOne ERP will not permit you to delete a product item that has any outstanding documents including unprocessed information and transactions that have not cleared.

Audit Trail

You can assigned each item, or group of items to a specific inventory control account in the general ledger. The control account and subaccount number can sort various reports in the Inventory Control. This, in turn, allows the subsidiary ledger and the general ledger to be reconciled.

COMPREHENSIVE INVENTORY CONTROL REPORTING

You can quickly and easily access any information that you need using the extensive inventory cross-

reference features. Users may identify quantity on hand, quantity avaiable, quantity on back orders, costs and list prices.
